

iOS Assignment

Assignment: Wikipedia

Clone the Wikipedia app from GitHub (<https://github.com/wikimedia/wikipedia-ios>). The Wikipedia app can be called from other apps via deep linking.

Modify the Wikipedia app so that it can be called in a way so that, when started, it directly goes to the 'Places' tab and shows the location specified by the calling app (e.g. via coordinates), instead of the current location.

Create a simple test app with a list of locations.

- **Your app should fetch locations from** <https://raw.githubusercontent.com/abnamrocoesd/assignment-ios/main/locations.json>
- Tapping on a location should call the Wikipedia app in this new way to demonstrate the functionality.
- The user of the test app should be allowed to enter a custom location and open the Wikipedia app there.

Assignment requirements:

- Use SwiftUI for the 'Places' app
- Don't forget a ReadMe
- Think of unit tests
- Bonus points showing knowledge of Swift Concurrency, Accessibility
- Work locally and perform your changes locally (but still using git).

Once done, share a public GitHub link with me
